

# MAG TOUCH

wachdienstsysteme e.U.

Operation in a nutshell:

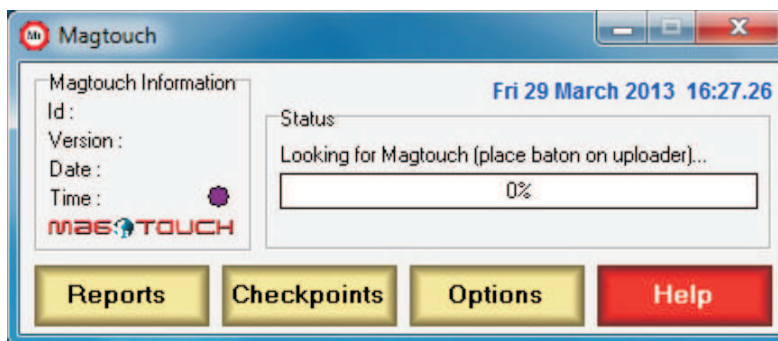

To record the number of an ID button, touch it with the reading head of the **magtouch** baton.

Make sure that the LED indicator light at the end of the baton flashes only once.

This operation has now date- and time-stamped the clocked ID number and stored it securely in the internal memory of the baton.

At the end of the shift, the **magtouch** baton is taken to the PC on which the downloader software is installed. Now the program is opened and we wait until the indication “**Looking for Magtouch (place baton on uploader)**” appears on the screen.

The baton is now put onto the contact points of the download unit as shown in the picture below and the data contained in the patrol baton is transferred to the PC. When the data transfer is complete, the memory of the baton is cleared.
